

Import alarms from Siemens TIA Portal (WinCC RT Professional) to Nimbus

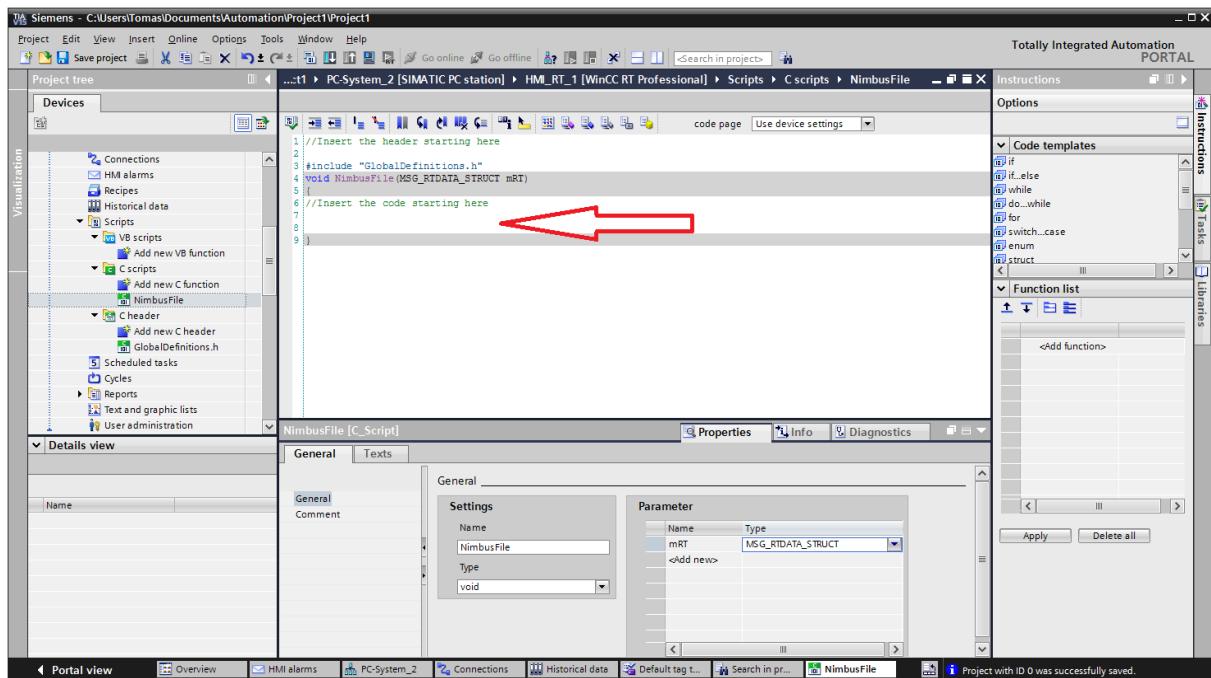

WinCC RT Professional can export HMI alarms to Nimbus using a text file created by a C-script

Configure WinCC to create the Nimbus readable alarm event text file

Add a new C-script in the Project view -> PC-system -> HMI_RT -> Scripts -> C scripts. Name the script *NimbusFile*.

Create a new function named *NimbusFile* of type void.

Add parameter *mRT* of type *MSG_RTDATA_STRUCT*.

Copy the program code from the *NimbusFile* C-script section below and insert it into the void *NimbusFile(MSG_RTDATA_STRUCT mRT)* function (red arrow)

```

41 pError=&Error;
42
43 memset (&MsgData, 0, sizeof(MSG_CSDATA_STRUCT));
44 memset (&MsgClass, 0, sizeof(MSG_CLASS_STRUCT));
45
46 // create message-string and filename if state is correct
47
48 if (mRT.dwMsgState == MSG_STATE_COME || mRT.dwMsgState == MSG_STATE_GO ||
49 mRT.dwMsgState == MSG_STATE_QUIT)
50 {
51
52 // Open file, this file must be located somewhere where we have read/write/delete access rights
53 pfExport = fopen("C:\\ProgramData\\TrioSoft\\Nimbus Alarm Server 3\\Project\\alarm.txt","a");
54
55 if (pfExport != NULL)
56 {
57
58 if (MSRTStartMagService(&dWID, NULL, NULL, 0, NULL, pError))
59 {
60
61 sprintf (date, "%04d-%02d-%02d", mRT.stMsgTime.wYear, mRT.stMsgTime.wMonth, mRT.stMsgTime.wDay);
62 sprintf (time, "%02d:%02d:%02d", mRT.stMsgTime.wHour, mRT.stMsgTime.wMinute,
63 mRT.stMsgTime.wSecond);
64
65 MSRTGetMsgCSData (mRT.dwMsgNr, &MsgData, pError);
66
67 MSRTGetClassInfo (mRT.dwMsgNr, &MsgClass, pError);
68 MSRTGetMsgText (0, MsgClass.dwName, &mcsClass, pError);
69
70 MSRTGetMsgPriority (MsgData.dwMsgNr, (long)&lPriority, pError);
71
72 //
73 // Example of file to Nimbus:
74 //
75 // 2020-01-22#07:04:43#00902_VS01_CP01_AL#Aktiv#0#A-alarm#Circulation pump VS01#

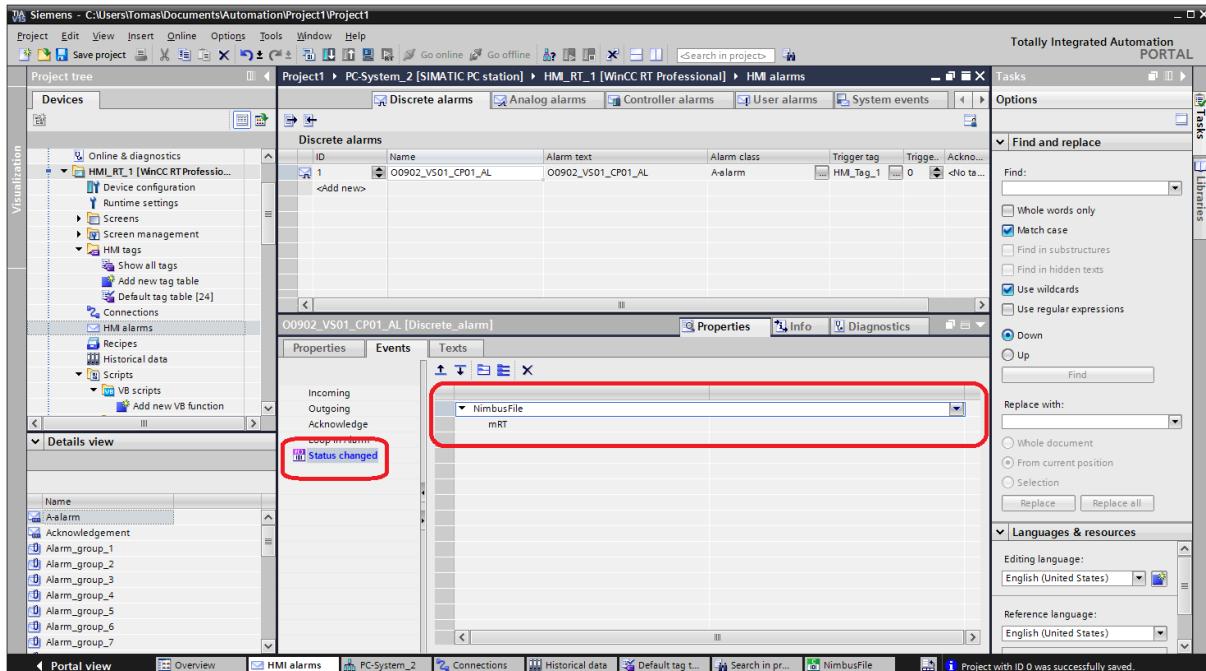

```

Edit the row with the path and filename if needed. It will by default point to the *Nimbus version 3 project folder*. The folder is created when *Nimbus* is installed. You can choose any folder you like as long as both *Nimbus* and *WinCC* have security settings allowing the applications to create and delete files in that folder.

Use the *Edit -> Check syntax* menu choice to ensure the code is ok and save the project

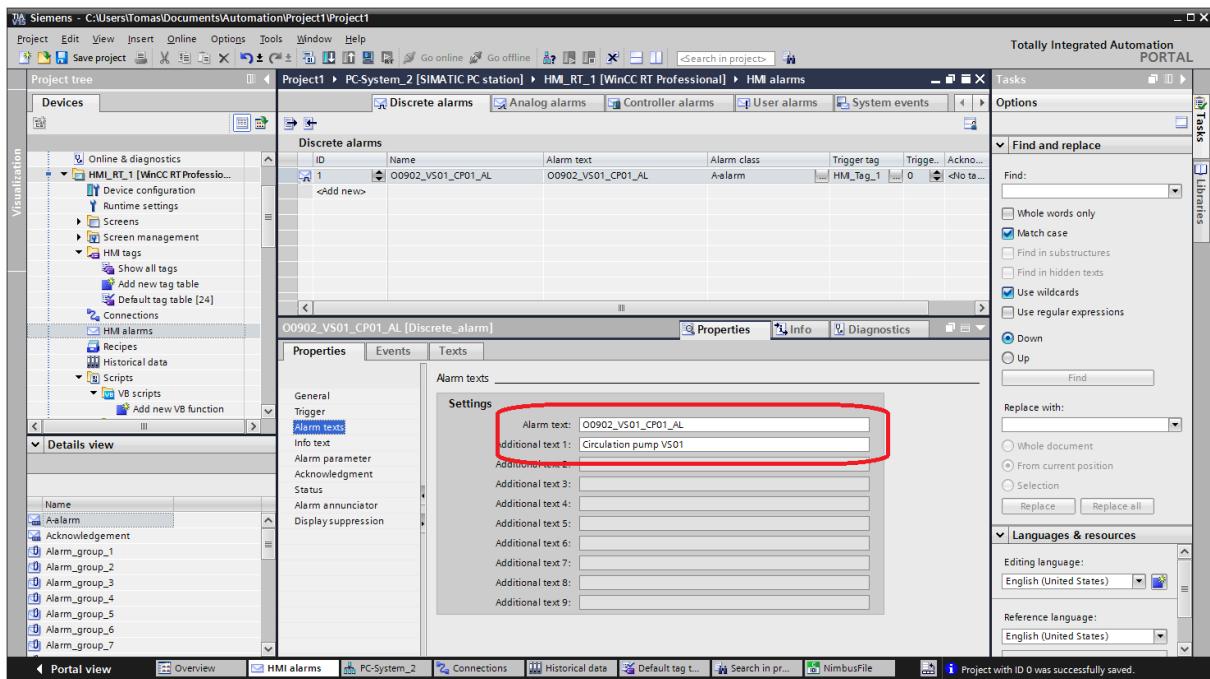

Open *HMI Alarms*.

Goto *Events -> Status changed*. Select the alarms that should send their alarm events to *Nimbus* and add function *NimbusFile*.

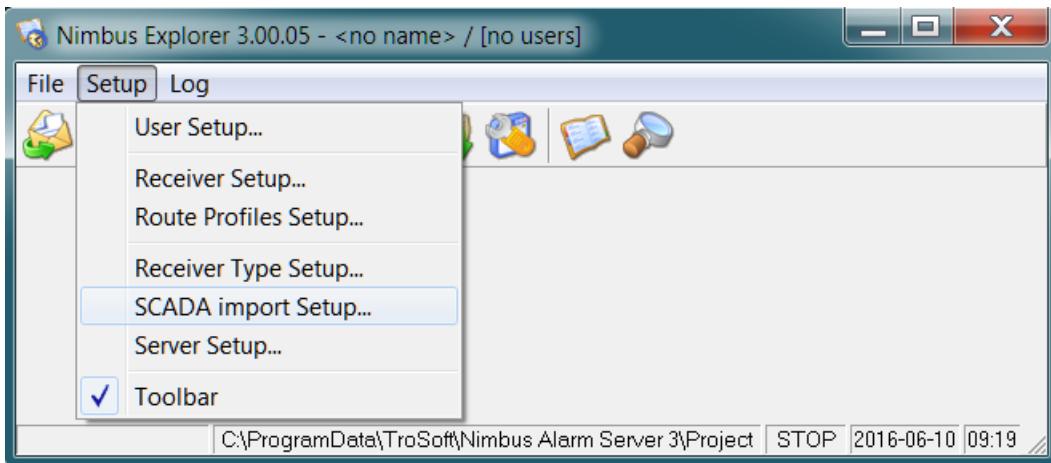

Obs! Remember to add this function if new HMI alarms are created in the future.

Nimbus will by default use the first two text fields (inserted into fields *T0 (Tag)* and *T4 (Description)*):

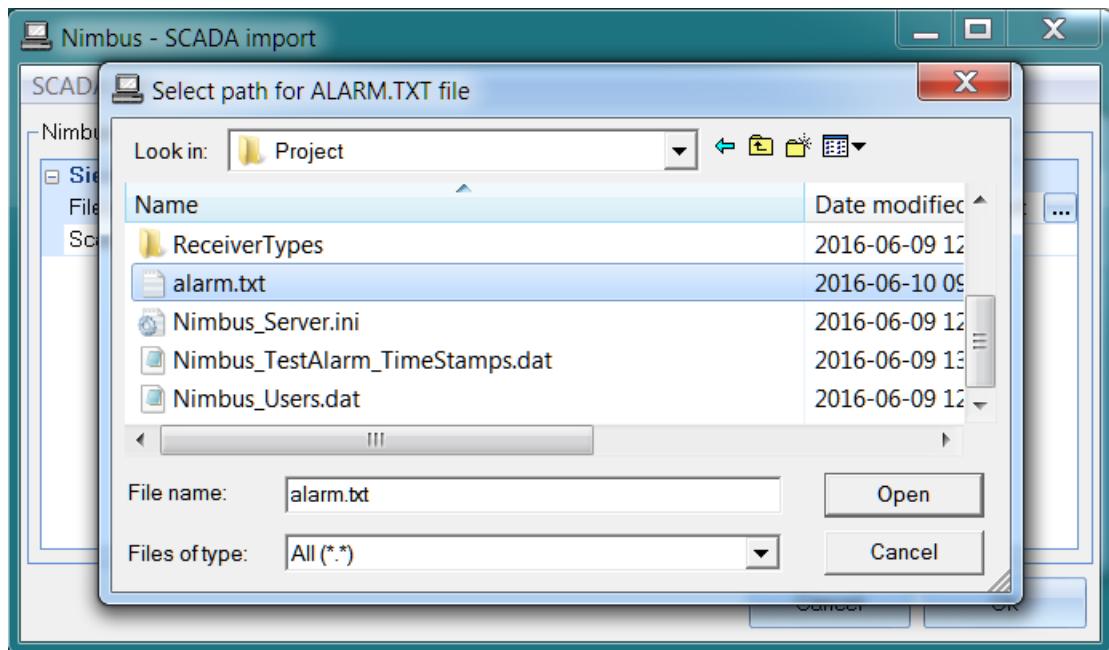

Configure Nimbus to import the alarm event text file

Run *Nimbus Explorer* (right click and select *Run as Administrator*) using its shortcut. *Nimbus Explorer* shall always be run as *Administrator*.

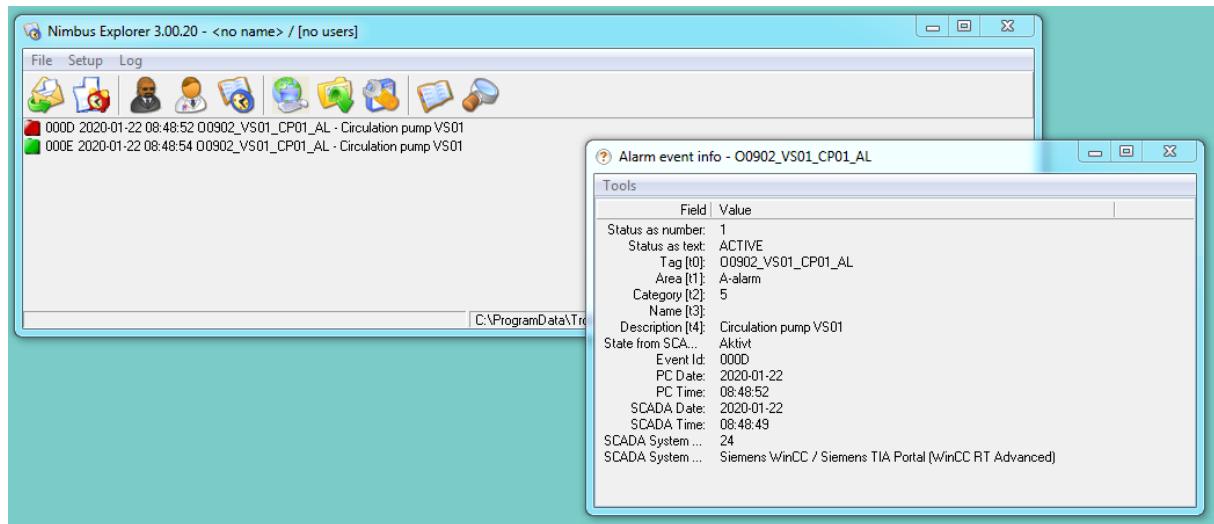

Select *Setup -> SCADA Import Setup*.

Select *SCADA System* -> *Add SCADA System Import* -> *Siemens WinCC*

Select *alarm.txt* found in the same folder that was set in the script. If the file does not exist, just select *Open*. Ensure the *File path to scan* also included the textfile name.

When you run *Nimbus Alarm Server*, the program will remove the textfile because it contains just old alarm events. Create a new alarm in *WinCC*. It should now appear in *Nimbus Explorer*. Below is alarm events from the WinCC example above:

Nimbus always remove the file when it has been read

NimbusFile C-script

```
//
// Date      / Vers   / Sign / Comment
// -----
// 2016.02.26 / 1.0.0.0 / TR  / Major changes
// 2016.02.27 / 1.0.0.1 / TR  / Added priority and Class moved to Area
```

```

// 2016.03.18 / 1.0.0.2 / TR / Added Text block 2
// 2020.01.21 / 1.0.0.3 / TR / Changed WinCC code to TIA WinCC RT Professional
//
//
